Dudáš M. (ed.), Eliáš P., Eliáš P. jun., Górecki A., Hrvnák M., Hrvnák R., Malovcová-Staníková M., Marcinčinová M. & Pliszko A. (2020): New floristic records from Central Europe 6 (reports 81-98). – Thaiszia – J. Bot. 30 (2): 209-220.

Abstract: The presented sixth part of the series includes 18 new chorological records of vascular plants, five from Poland and thirteen from Slovakia. In Poland, the first spontaneous occurrence of *Clinopodium nepeta* subsp. *nepeta* outside cultivation is reported from Kraków. Also new localities of *Euphorbia maculata*, *Panicum capillare*, *Plantago coronopus* and *Sympyotrichum ciliatum* from southern Poland were found. In Slovakia, new records of alien *Cardamine occulta*, *Lindernia dubia*, *Nigella damascena*, *Pistia stratiotes* (with map of known records), *Sagittaria latifolia*, *Senecio inaequidens*, *Silybum marianum* and *Vinca major* were done as well as autochthonous *Cotoneaster melanocarpus*, *Herniaria hirsuta*, *Verbascum speciosum* and *Xeranthemum annuum*.

Keywords: chorology, vascular plants, new findings, Poland, Slovakia, native species, alien, red list species.

This is an ongoing report in the established series dealing with new chorological data on higher vascular plants in Central Europe (for details, see *Thaiszia* – *J. Bot.* 28 (1), pp. 79–80, 2018).

The nomenclature of taxa follows the Euro+Med PlantBase (Euro+Med 2006-) and/or Chromosome number survey of the ferns and flowering plants of Slovakia (Marhold et al. 2007), herbarium acronyms follow Thiers (2020+).

The publication includes contributions by M. Dudáš (81-82), P. Eliáš jun. & P. Eliáš (83-86), R. Hrvnák (87-89), R. Hrvnák & M. Hrvnák (90), M. Malovcová-Staníková (91), M. Marcinčinová (92-93) and A. Pliszko & A. Górecki (94-98) arranged alphabetically.

Matej Dudáš (reports 81-82)

SK

81. *Sagittaria latifolia* Willd.: the Východoslovenská nížina Lowland, river Trnávka between Trebišov and Hraň, scattered and on few places frequent in 9 km long part of the river, 100 m, from 48°36'34.77"N 21°44'5.08"E to 48°32'46.2"N 21°47'30.4"E, 7396c, 7496a+b+d, 26. 7. 2020, M. Dudáš, KO 35698-35699.

North-american alien species known only from three localities in southern part of Slovakia (Nobis et al. 2019; Dudáš et al. 2019). First record of the garden escaping in the Východoslovenská nížina Lowland. It colonizes both banks of the Trnávka river from the town of Trebišov to Hraň village in 9 km long part of the river. It is frequent in few places and its invasive potential became dangerous. The southernmost plants were recorded over weir (east from Hraň) on downstream part of the Trnávka river before its flow into the Ondava river. The origin is perhaps located in the garden settlement in south-eastern part of Trebišov.

82. *Vinca major* L.: the Strážovské vrchy Mts., Omastiná, northern part of the village, garden escapee, established in two separate neighbouring areas, very frequent along the road, 360 m, 48°46'45.1"N 18°23'25.9"E, 7276a, 7. 5. 2020, M. Dudáš, KO 35530, photodocumentation.

Mediterranean species; in Slovakia it is known as a garden escapee from less than 4 locations (Medvecká et al. 2012). The first report on the garden escaping in Slovakia concernes the proximity of the town of Modra in the foothill of the Malé Karpaty Mts (Hajdúk 1975). In northern part of Omastiná village it was found in two separate areas. The first one is located on the regulated stream right embankment (monodominant area of ca 10 m²) and the second one along the road over a ditch (left embankment) with the colonization of the nearest hornbeam forest on the area ca 12 m².

Pavol Eliáš jun. & Pavol Eliáš (reports 83-86)

SK

83. *Cotoneaster melanocarpus* (Bunge) Loudon: the Pohronský Inovec Mts., the Veľký Inovec hill, 3 individuals on rocks at the top of hill, 892 m, 48°24'36.2"N 18°32'36.8"E, 7577c, 7. 8. 2020, P. Eliáš jun. & P. Eliáš, NI. – the Pohronský Inovec Mts., Obyce, on the rocks of a rocky ridge towards the top of Skerešov hill, a single individual, 419 m, 48°25'55.6"N 18°28'22.9"E, 7576d, 2. 6. 2009, P. Eliáš jun., NI.

The species is rare in this area. From the phytogeographical district of Pohronský Inovec, there are only two records of *C. melanocarpus* from the surroundings of Hronský Beňadik town [(Baranec 1992 ut *C. nigra* (Ehr.) Fries] and one record from the surroundings of the Čaradice village (Benčať et al. 1982, p. 86), which is probably a mistake because the edge of the oak-beech forest is mentioned as a habitat. However, *C. melanocarpus* occupies rocky ridges, slopes and cliffs. From the top of the Veľký Inovec hill, a single individual of *C. integrifolius* is mentioned (Benčať et al. 1982, p. 85). We believe that this one is from the same *C. melanocarpus* plants as we found here, but the species was not correctly identified by Benčať et al. (l. c.) because it is a taxonomically complicated genus (Kšíňan et al. 2020).

84. *Herniaria hirsuta* L.: the Podunajská nížina Lowland, Bratislava, Rudnayovo námestie square and Panská ulica street, 145 m, 48°08'29.7"N 17°06'20.0"E, 7868d, 18. 7. 2017, P. Eliáš, NI.

A new locality of the rare annual species evaluated in the category “endangered” (Eliáš et al. 2015) and at the same time the verification of its occurrence in Bratislava, where the lastest data were pulished in 1998 (Valenta 1998 BRA in Eliáš jun. 2012). *Herniaria hirsuta* prefers disturbed habitats of anthropogenic origin – railway embankments, sidewalk edges, country roads, vineyards and fields on sandy and clay soils. The species occurs in Europe, West Asia and North and East Africa, in Slovakia only in the western part (Sutorý 1980; Eliáš jun. l. c.).

85. *Senecio inaequidens* D.C.: the Podunajská nížina Lowland, Nitra, A. Hlinku Street, a single individual at the road edge, 137 m, 48°18'29.4"N 18°05'37.3"E, 7674d, 30. 9. 2019, P. Eliáš jun., NI.

No data of *S. inaequidens* have been known in the close surrounding of Nitra yet. *Senecio inaequidens*, an alien weed from South Africa, was introduced into Europe at the end of the 19th century (Kaplan et al. 2018). In Slovakia, the species is distributed especially in W and SW part (Jehlík 1998; Feráková 2002). The number of sites seems to be gradually growing, with the species spreading mainly by the road transport (Kocián 2016). As it is evident from the published data of the adjacent countries, the species is spreading eastwards (Pliszko 2017; Haszonits & Schmidt 2018).

86. *Verbascum speciosum* Schrad.: the Podunajská nížina Lowland, Vlkanovo, along the road to the farmstead and adjacent grassland, some hundreds of individuals, 116 – 118 m, 47°56'31.8"N 18°14'21.3"E, 8075c, 15. 7. 2020, P. Eliáš jun., NI.

New locality of the relatively rare *Verbascum* species, it is evaluated in the category “near threatened” (NT) in actual version of the Slovak Red List of ferns and flowering plants (Eliáš et al. 2015). The closest locality of the species is near the Dvory nad Žitavou railway station (Holub & Eliáš 1999), we believe *V. speciosum* most likely spread to this new locality from it. The origin of the species in Slovakia is not clear; Králik (2009) believes that it came to this region in the 16th century as a medicinal plant in connection with the arrival of Croats to Central Europe due to the expansion of the Ottoman Empire.

Richard Hrvnák (reports 87-89)

SK

87. *Cardamine occulta* Hornem.: the Lučenská kotlina Basin, Lučenec town, centre of the town, the garden shop on the J. M. Hurbana street, 184 m, 48°19'30.39"N 19°40'18.44"E, 7684c, 4. 5. 2019, R. Hrvnák, SAV. – the Lučenská kotlina Basin, Lučenec town, centre of the town, garden shop on the Mieru street, 185 m, 48°19'59.29"N 19°40'15.74"E, 7684c, 4. 5. 2019, R. Hrvnák, SAV.

Cardamine occulta is an Asian weedy species first mentioned from the territory of Slovakia in 2002 and recently known from 16 localities mainly in the western, and occasionally in the Central Slovakia (Prievidza and Zvolen towns; Šlenker et al. 2019). On both the new localities, the individuals of the species grew in flower pots.

88. *Lindernia dubia* (L.) Pennel: the Lučenská kotlina Basin, Lučenec town, Water reservoir Ľadovo, exposed bottom in the north-western part of the reservoir, 193 m, 48°20'4.4"N 19°37'30.5"E, 7683d, 7. 8. 2019, R. Hrvnák, SAV.

This alien species, native to North America, was found in the territory of Slovakia recently (Hrvnák et al. 2016) and it is known from 3 localities: near Trenč, Štiavnické Bane and Štúrovo (Schmotzer 2015; Kochjarová et al. 2015; Dítě & Dítě 2019). Similarly to the previous findings, the vegetation on the newly found locality near Lučenec town was classified into vegetation of exposed bottom of *Isoëto-Nanojuncetea* Br.-Bl. et Tx. in Br.-Bl. et al. 1952. The population counted ca 100–200 individuals in the time of observation. The next year (2020), when the whole reservoir was drained, *L. dubia* grew in various parts of the reservoir bottom in vegetation of the classes Isoëto-Nanojuncetea and later *Bidentetea* Tx. et al. ex von Rochow 1951; the population counted thousands of individuals.

89. *Pistia stratiotes* L.: the Podunajská rovina Lowland, Kolárovo town, south of the town, near the road to Kameničná village, road ditch filled by thermal water from closed artificial thermal spring, 112 m, 47°51'30.5"N 18°0'19.1"E, 8174a, 5. 9. 2017, R. Hrvnák & K. Bubíková, SAV. – the Podunajská rovina Lowland, Nové Zámky, north-

eastern margin of the town, Nitra river arm below a thermal swimming pool, 128 m, 47°59'46.1"N 18°11'3.4"E, 8075a, 24. 10. 2017, R. Hrvnák, SAV.

Alien aquatic plant, first time recorded in Slovakia in 2007 (Tóthová et al. 2007) with the occurrence in south-western Slovakia (Hrvnák et al. 2019) and strong concentration on the Čierna voda river near Kráľová pri Senci (Ružičková et al. 2020). Two newly presented localities were also found in the Podunajská rovina lowland, however, the distribution area of the species in Slovakia expanded more to east (Fig. 1).

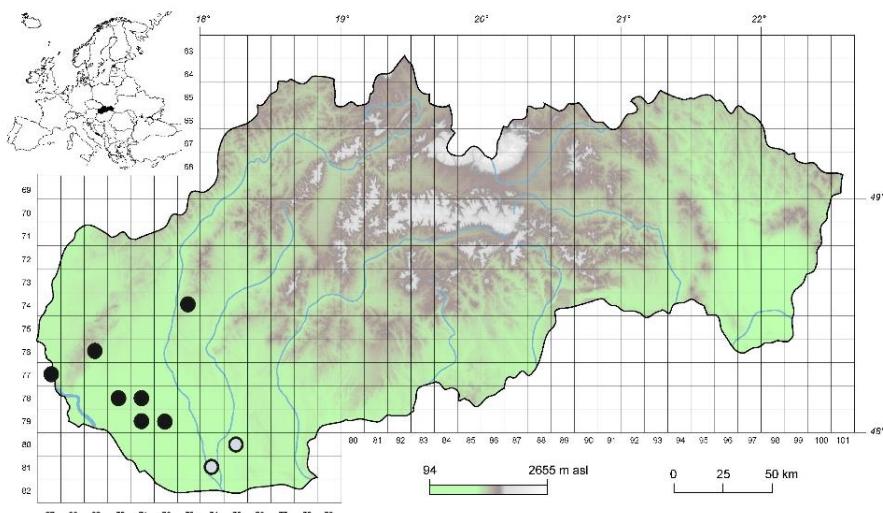

Fig. 1 Recent records of *Pistia stratiotes* in Slovakia (black circles – previously mentioned localities, shaded circle – new findings).

Richard Hrvnák & Matúš Hrvnák (report 90)

SK

90. *Sagittaria latifolia* Willd.: the Rimavská kotlina Basin, Číž – spa, Barický potok stream near the spa house Detva, 169 m, 48°18'51.46"N 20°16'46.38"E, 7687d, 3. 10. 2019, R. Hrvnák & M. Hrvnák, photodocumentation.

Alien macrophyte species was known only from three localities in southern part of Slovakia (Nobis et al. 2019; Dudáš et al. 2019). The species growth on the locality in Číž – spa covered ca 10 m² across the stream watercourse. The species occurrence is probably related to its planting in the closed small ponds hydrologically connected with the stream.

Miroslava Malovcová-Staníková (report 91)

SK

91. *Xeranthemum annuum* L.: the Nitrianska pahorkatina Hills, Posádka - part of the Dvorníky village, Verešovo land area, near Bereg Garden Settlement, 180 m, 48°21'56.2"N 17°45'56.2"E, 7672b, 9. 7. 2020, M. Malovcová, photodocumentation.

Probably the first record from this locality.

Margaréta Marcinčinová (reports 92-93)

SK

92. *Nigella damascena* L.: the Košická kotlina Basin, Košice, City District Západ, Medická 4 street, only single flowering plant at the roadside, disturbed grass-plot, 240 m, 48°43'7.323"N 21°14'33.240"E, 7293c, 3. 6. 2020, M. Marcinčinová, KO: 35710.

Note of editor: casual garden escapee. According to Medvecká et al. (2012) it is considered a neophyte species in Slovakia.

93. *Silybum marianum* (L.) P. Gaertn.: the Košická kotlina Basin, Košice, City District Západ, Považská 1 street, single flowering plant next to building, ruderalized lawn, 240 m, 48°43'4.627"N 21°14'26.983"E, 7293c, 25. 5. 2020, M. Marcinčinová, photodocumentation.

Note of editor: casual garden escapee. According to Medvecká et al. (2012) it is considered a neophyte species in Slovakia. In the fields around Košice it has not been cultivated.

Artur Pliszko & Artur Górecki (reports 94-98)

PL

94. *Clinopodium nepeta* (L.) Kuntze subsp. *nepeta*: southern Poland, Lesser Poland Province, Kraków, Lwowska Street, one flowering plant in a gap between the sidewalk and sewage gully, near the flowerbed of roses, 201 m, 50°02.646'N 19°57.502'E, 11. 9. 2020, A. Pliszko, KRA 0557639.

Clinopodium nepeta subsp. *nepeta*, a perennial plant of Lamiaceae, is native to Southern and South-Central Europe, Transcaucasia, Lebanon-Syria and Iran. It was introduced to Western and North-Central Europe, North America and New Zealand (Plants of the World online 2020). It occurs in *Pinus-Quercus* forests, phrygana, grasslands, dry meadows, cliffs, screes, dry river bed banks and ruderal habitats, in mountains and plains (Morales & Luque 1997; Alan & Ocak 2009). In Europe, naturalization of *C. nepeta* subsp. *nepeta* has been observed in Belgium (Randall 2017 and reference therein). It was also recorded as a casual alien in the Czech Republic (Pyšek et al. 2012). In Poland, as in other countries, it is an ornamental,

medicinal and edible plant cultivated in gardens and flowerbeds, mostly in urban areas. This is the first spontaneous occurrence of *C. nepeta* subsp. *nepeta* outside cultivation in Poland. It was found about 40 m from the nearest place of its cultivation (flowerbed with other ornamentals). Currently, it should be classified as a casual alien plant in the Polish flora. It was identified based on morphological features provided by Bacchetta & Brullo (2005) and Alan & Ocak (2009).

95. *Euphorbia maculata* L.: southern Poland, Lesser Poland Province, Zabierzów, several dozen flowering plants in the gaps between sidewalk stones, 225 m, 50°07.067'N 19°48.034'E, 8. 10. 2020, A. Pliszko & A. Górecki, KRA 0557622.

Euphorbia maculata, an annual plant of Euphorbiaceae, is native to North America. It was introduced to South America, Europe, Asia, Africa and Australia (Randall 2017 and references therein). It usually occurs in open habitats such as grasslands, fields, gardens, lawns and roadsides (Eliáš jun. 2009; Pahlevani & Riina 2011; Urbisz 2019 and others). In Poland, it is a very rare species known from four localities in southern and central parts of the country (Zająć & Zająć 2019). According to Tokarska-Guzik et al. (2012), *E. maculata* belongs to established alien species (kenophytes) in the Polish flora. It has been recorded as a weed in the botanical gardens in Kraków and Wrocław, as well as in a monastery garden in Ożarów Mazowiecki. Recently, it was found between sidewalk stones in a tram stop in Katowice (Urbisz 2019 and references therein). This is the second record of *E. maculata* in Lesser Poland Province. It was identified based on morphological features provided by Pahlevani & Riina (2011) and Verloove (2013).

96. *Panicum capillare* L.: southern Poland, Lesser Poland Province, Brzegi near Kraków, several hundred flowering plants on roadside verges and banks of fish ponds near aggregate mine, 195 m, 50°02.104'N 20°05.116'E, 20. 9. 2020, A. Pliszko, KRA 0557631, 0557632 – Kraków, near Płaszów, five flowering plants on a wasteland, 208 m, 50°01.623'N 20°00.247'E, 16. 9. 2020, A. Pliszko & A. Górecki, KRA 0557630.

Panicum capillare, an annual species of Poaceae, is native to North America. It was introduced to South America, Europe, Asia, Africa and Australia (Clements et al. 2004; Randall 2017 and references therein). It occurs in disturbed and eroded soils of floodplains and beaches, loess prairies and burned *Pinus banksiana* Lambert forests. It also occurs in anthropogenic habitats such as cultivated fields, meadows, gardens, and waste areas, roadsides, clearings, ditches and abandoned fields (Clements et al. 2004 and references therein). In Europe, *P. capillare* is naturalized in many countries (e.g., Portugal, Spain, Croatia, Romania, Germany, the Czech Republic, Slovakia, Lithuania and Belarus) (Randall 2017 and references therein). In Poland, it is usually treated as an ornamental plant cultivated in gardens (Mirek et al. 2002). However, Nobis & Nobis (2006) suggested that *P. capillare* is an established alien plant in south-eastern Poland. The status and distribution of *P. capillare* in Poland are neglected, considering the data provided by Tokarska-Guzik et al. (2012) and Zająć & Zająć (2019). This is the next record suggesting that *P. capillare* is an

established alien plant in the Polish flora. The species was identified using morphological features provided by Clements et al. (2004) and Király & Alegro (2015).

97. *Plantago coronopus* L.: southern Poland, Lesser Poland Province, Modlniczka near Kraków, several dozen flowering plants on a verge of highway, 243 m, 50°06.378'N 19°50.923'E and several dozen flowering plants in a highway median, 242 m, 50°06.376'N 19°50.997'E, 3. 10. 2020, A. Pliszko & A. Górecki, KRA 0557624, 0557625, 0557626.

Plantago coronopus, an annual, biennial or perennial species of Plantaginaceae, is native to Europe, Northern Africa, Western and Central Asia. It was introduced to North America, South America, South Africa, and Australia (CABI 2020). It is a halophyte occurring mostly along coastal areas. In Poland, it is a native species, critically endangered and strictly protected by law (Sotek 2014; Rozporządzenie... 2014). Its native geographical range in Poland is restricted to a small area along the Baltic coast, in the north-western part of the country (Sotek 2014; Zajac & Zajac 2019). However, it was introduced to other regions in north-western and south-western Poland where it is found in anthropogenic habitats (Sadowska & Żółkoś 2011; Zajac & Zajac 2019), especially on roadside verges of highways which are regularly treated with salt during winters (Nowak & Nowak 2018). This is the first record of *P. coronopus* in Lesser Poland Province. Further spread of the species along highways in Poland is expected. The species was identified following Rutkowski (2004).

98. *Symphytum ciliatum* (Ledeb.) G. L. Nesom: southern Poland, Lesser Poland Province, Brzegi near Kraków, several dozen flowering plants on a roadside verge, 190 m, 50°01.906'N 20°05.688'E, 20. 9. 2020, A. Pliszko, KRA 0557644. – several tens of thousands flowering specimens on a wet wasteland near aggregate mine, 194 m, 50°01.829'N 20°04.403'E, 2. 10. 2020, A. Pliszko & A. Górecki, KRA 0557645, 0557646 – Kryspinów near Kraków, several dozen flowering specimens in a ruderal ground near the barrage on the Vistula river, 202 m, 50°01.899'N 19°49.105'E, 25. 9. 2020, A. Pliszko, KRA 0557643 – Kraków, Łagiewniki, one flowering plant on a verge of renovated road, 211 m, 50°01.275'N 19°55.925'E, 27. 9. 2020, A. Pliszko, KRA 0557640 – Kraków near Bonarka, several tens of thousands flowering plants on a wet wasteland, 223 m, 50°01.522'N 19°56.835'E, 26. 9. 2020, A. Pliszko & A. Górecki, KRA 0557641, 0557642.

Symphytum ciliatum, an annual species of Asteraceae, is native to North America and Eurasia (Brouillet et al. 2006). It occurs on moist, brackish soils, in prairies, steppes and salt marshes. It is also found in anthropogenic habitats such as irrigation channels, winter-salted highways, railroads and waste grounds (Brouillet et al. 2006; Sârbu & Smarandache 2015). It was introduced to Western and Central Europe (i.e., Belgium, Slovakia, Poland, Moldova and Romania) (Randall 2017 and references therein). Its invasive status has been confirmed in Romania (Sârbu &

Smarandache 2015). In Poland, *S. ciliatum* is treated as an established alien (kenophyte) and a potentially invasive species (Tokarska-Guzik et al. 2012). It is rarely distributed in south-eastern part of the country (Zajac & Zajac 2019). It is usually found in ruderal habitats such as roadside verges, railway areas, construction sites, quarries, and wastelands (Bróz & Podgórska 2005; Szymański 2010; Stadnicka-Futoma & Oklejewicz 2013; Nobis & Pliszko 2016). It has been presented in Kraków since the 1980s (Guzik 2003). The new records suggest that *S. ciliatum* is locally invasive in wet ruderal habitats in Kraków and Brzegi. Identity of *S. ciliatum* was confirmed using morphological features provided by Bróz & Podgórska (2005) and Brouillet (2006).

Note of editor: In Slovakia, it was first reported from Košice (eastern Slovakia) by Mikoláš (1988) under name *Brachyactis ciliata* (Ledeb.) Ledeb. and in the present, it spreads inconspicuously and slowly along roads within the town (Dudáš et al. 2020).
