General Information			
Course name	Quantum Theory of Magnetism	**ECTS Credits**	5
		Semester	Summer 3 hours/week lecture

Aims

To solve the simplest quantum spin models in the field of quantum theory of magnetism using the advanced methods such as Bethe ansatz, spin-wave theory, Jordan-Wigner fermionization, and variational method.

Contents

An introduction to the quantum theory of magnetism, the definition of basic lattice-statistical models in magnetism: Ising model, Heisenberg model, Hubbard model, t-J model. Exchange interaction and its quantum-mechanical origin. Quantum mechanics of the orbital and spin angular momentum. The second-quantization formalism, introduction of raising and lowering (ladder) operators, basic commutation rules between the ladder operators. An elementary quantum theory of two interacting magnetic particles. (1.-3. week)

The ground state and excited states of the one-dimensional quantum Heisenberg model with the ferromagnetic interaction. Spin waves as collective excitations of a spin chain, bound spin excitations. The grounds of Bethe-ansatz method, the examples with two and three spin deviations. The ground state of the one-dimensional quantum Heisenberg model with the antiferromagnetic interaction. A valence-bond crystal as the ground state of two geometrically frustrated Heisenberg models: Majumdar-Ghosh model and Shastry-Sutherland model. (4.-6. week)

The exact solution for the one-dimensional quantum XY model in a transverse magnetic field. The fermionization of spin operators with the help of Jordan-Wigner transformation, Fourier and Bogoliubov transformations. The ground-state energy, magnetization process and quantum critical points. The behaviour of thermodynamic quantities at non-zero temperatures. (7.-9. week)

The spin-wave theory for the generalized quantum Heisenberg model of arbitrary spatial dimension and spin quantum number. The bosonization of spin operators through the Holstein-Primakoff transformation. The simple linear spin-wave theory and the extended theory of interacting spin waves. The simple spin-wave theory for the ferromagnetic and antiferromagnetic quantum Heisenberg model. (10.-13. week)
